

# METHOD FOR MANAGING INCOMING CALLS ON A MOBILE PHONE

## Abstract

The present invention provides a method for managing incoming calls of a mobile phone. The mobile phone includes a control circuit and a volume detector. The method includes (a) receiving a call signal by the mobile phone, (b) detecting environmental volume surrounding the mobile phone with the volume detector, and (c) executing a first managing process with the control circuit when the detected surrounding volume exceeds a predetermined value, or executing a second managing process with the control circuit when the detected surrounding volume does not exceed the predetermined value.
